ABSTRACT

The use of hand sanitizers has risen as a result of the pandemic. Hand hygiene is one of the most important measures to prevent the spread of infectious diseases. Although the usefulness of hand sanitizer is variable, it is employed as a simple means of infection regulator in a broader areas such as daycare centers, universities, hospitals, health care clinics and super markets. As a result of growing alertness about hand hygiene and its benefits, there has been a continuous growth in claim of hand sanitizers. Hand sanitizers are especially useful in offices and work environments because they can prevent the spread of infection and diseases, which ultimately lower the levels of absenteeism and presenteeism. Illnesses increase the number of sick leaves taken by workers. By helping in maintaining the health of workers, employers will not only provide a safer and healthier work environment but will also boost workers morale and motivate them to work harder. If a workers have peace of mind that they will safe from viruses and bacteria while at work, they will be able to focus on their work properly. This will significantly improve their productivity, which is always a good thing. And a healthy mind and body mean happy working time always. This report highlights the confidence of workers at work with the use of hand Sanitizers in this present pandemic situation with reference to Virudhunagar. For the study, the population in Virudhunagar was taken and data was collected using unstructured questionnaire from the 100 sample respondents. Hand sanitizer's help in reducing the effect of corona virus and kills it. India is facing with a major outbreak of coronavirus, and the situation is deteriorating due to the second version of the virus.

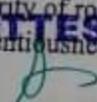

Keywords: Hand hygiene, Hand sanitizers, safety, work place. Pandemic, workers, Covid 19.

INTRODUCTION

Hand sanitizer, also called hand antibacterial or hand clean, negotiator applied to the hands for the persistence of killing disease-causing creatures. Hand hygiene is one of the most important measures to prevent the spread of infectious viruses. Hand sanitizer use is suggested when soap and water are not accessible for hand washing or when repeated hand washing negotiations the normal skin barrier. Although the usefulness of hand sanitizer is variable, it is employed as a simple means of infection regulator in a broader areas such as daycare centers, universities, hospitals, health care clinics and super markets. As a result of growing alertness about hand hygiene and its benefits, there has been a continuous growth in claim of hand sanitizers. Hand sanitizers come in spray, lotion or fluid form. In most settings, hand washing with cleanser and water is preferred. Hand sanitizer is less active at carnage certain types of microorganisms, such as norovirus and Clostridia difficile, and dissimilar hand washing, it cannot substantially eradicate injurious substances. Workers may incorrectly rub off hand sanitizer before it has dehydrated, and some are less active because of poor absorptions are too low.

STATEMENT OF THE PROBLEM

The ever-increasing number of labors might need good sanitation is a minister to health, comfort, and public safety. Current humanity is well aware of hygiene. Washing hands is one of the simplest, most effective ways to become free of microorganisms and evade infection. Transient viruses can be of any type, from any part of the body. As hands carry out the majority of roles of the human's body and are visible to a large extent, hands hygiene plays a chief conscientiousness. Herbal plants are the exclusive resources
